# What is Information Retrieval?

- Information Retrieval can be defined as a software program that deals with the organization, storage, retrieval, and evaluation of information from document repositories, particularly textual information.

- Information Retrieval is the activity of obtaining material that can usually be documented on an unstructured nature i.

- For example, Information Retrieval can be when a user enters a query into the system.

# What is Information Retrieval? contd.

- Not only librarians, professional searchers, etc engage themselves in the activity of information retrieval but nowadays hundreds of millions of people engage in IR every day when they use web search engines.

- Information Retrieval is believed to be the dominant form of Information access.

- Information retrieval also extends support to users in browsing or filtering document collection or processing a set of retrieved documents.

# What is an IR Model?

- An Information Retrieval (IR) model selects and ranks the document that is required by the user or the user has asked for in the form of a query.

-  The documents and the queries are represented in a similar manner, so that document selection and ranking can be formalized by a matching function that returns a retrieval status value (RSV) for each document in the collection.

-  Many of the Information Retrieval systems represent document contents by a set of descriptors, called terms, belonging to a vocabulary V.

# Components of Information Retrieval/ IR Model

# Acquisition

- In this step, the selection of documents and other objects from various web resources that consist of text-based documents takes place.

- The required data is collected by web crawlers and stored in the database.

# Representation

- It consists of indexing that contains free-text terms, controlled vocabulary, manual & automatic techniques as well.

- example: Abstracting contains summarizing and Bibliographic description that contains author, title, sources, data, and metadata.

# File Organization

- There are two types of file organization methods.

- Sequential : It contains documents by document data.

- Inverted : It contains term by term, list of records under each term.

# Query

- Queries are formal statements of information needs, for example, search strings in web search engines.

- In information retrieval, a query does not uniquely identify a single object in the collection.

- Instead, several objects may match the query, perhaps with different degrees of relevancy.

# User Interaction With Information Retrieval System

- The User Task: The information first is supposed to be translated into a query by the user.

-  In the information retrieval system, there is a set of words that convey the  semantics of the information that is required whereas, in a data retrieval system, a  query expression is used to convey the constraints which are satisfied by the objects.

-   Example: A user wants to search for something but ends up searching with another  thing.
